**Buyer contractual details**

This Order is for the G-Cloud Services outlined below. It is acknowledged by the Parties that the volume of the G-Cloud Services used by the Buyer may vary during this Call-Off Contract.

<b>G-Cloud lot:</b>	This Call-Off Contract is for the provision of Services under: [Lot 2 - Cloud Software]
<b>G-Cloud services required:</b>	<p>The Services to be provided by the Supplier under the above Lot are listed in Framework Section 2 and outlined below:</p> <ol style="list-style-type: none"> <li>1. Calling Line Identification Presentation</li> <li>2. Emergency Call Divert</li> <li>3. Fraud Management</li> <li>4. CLI Flexibility</li> <li>5. Call Admission Control</li> <li>6. Outbound Call Barring</li> <li>7. Fax, modem &amp; DTMF Support</li> <li>8. Provision of SIP Trunk and Management</li> <li>9. Provision of Virtual Modem and Infrastructure</li> <li>10. Cloud Hosting for the Virtual Modem</li> <li>11. Connectivity to EA Network</li> <li>12. Managed Service (ITIL3)</li> <li>13. Call Management Information</li> <li>14. Monthly Billing for Call Costs</li> </ol>
<b>Additional services:</b>	<p><b>SIP Connectivity</b></p> <p>The Supplier will provide a high speed resilient SIP Trunk service (with no single point of failure) for a maximum of 500 simultaneous calls in year 1 and 300 in year 2 (to be both incoming or outgoing calls and associated DDI numbers). These circuits will be installed and terminated on equipment located in the Supplier's Bolton and Elstree data centres. These circuits will provide 'MPLS quality loss less' connectivity.</p> <p>Inbound calls from the PSTN network will be routed through four geographically diverse BT IP Exchange POPs. Each BT POP will be configured to be able to route 166</p>

simultaneous calls (ports) giving an aggregate port capacity of 664 across the four POPs. This total port capacity of 664 means that the loss of a single BT POP will not affect the 500 simultaneous call switching capacity of the service in year 1. In year 2 the total port capacity will reduce to 400 ensuring that the loss of a single BT POP will not impact the 300 simultaneous call switching service.

Calls from BT IP Exchange will be evenly distributed to the Session Border Controllers (SBCs) hosted in the Supplier's Bolton and Elstree data centres. A total of three SBCs in year 1 and 2 in year 2 in each data centre will ensure high levels of resilience and in the unlikely event of a total loss of service through one data centre, the remaining facility is capable of supporting the load.

To optimise availability, redundant network connectivity will be provided to connect the BT IP Exchange POPs to the Supplier's SBCs. A network connectivity failure at either Elstree or Bolton will not affect the ability of the service to handle the required call load.

The SBCs will route the calls to the redundantly configured Vocal modem servers.

The Buyer will have the option to reduce the simultaneous call capacity of the service to a minimum of 300 in year 2. The required capacity changes may be submitted on a quarterly basis, ensuring that any reductions maintain port resilience at the BT POPs.

### Hosting

All of the active equipment will be hosted in the Supplier's United Kingdom data centres located in Bolton and Elstree which are purpose built to Tier-3 standards.

The Supplier's solution is built to deliver not less than 99.99% availability 24x7x365 with no single point of failure. Using the Supplier's Tier-3 data centres ensures a consistent level of environmental and connectivity resilience with n+1 air conditioning and n+n uninterruptible power supplies (UPS) with on-site backup generator, fire suppression system and multiple connectivity to the public Internet and on-net to the main carriers.

The power supply is protected using multiple un-interruptible power supplies and onsite generators to ensure a continuous and consistent electrical supply. A multi-layer model is adopted comprising in-house n+n UPS capacity and in-house generator provision. The n+n UPS capability provides first-line protection against power spikes and power failures with the in-house generator capability supporting this fully until mains power is restored. At the Supplier's Bolton data centre, there is an onsite generator supplying power to two separate UPS systems, each UPS system provides power to each rack via separate electrical distribution paths.

In both data centre locations, the Supplier has invested in multi-unit Riello Multi Sentry technology to provide n+1, single-phase provision to individual racks.

The generator is checked and started every week. Simulated power failures with full generator tests are performed every 6 months.

The Supplier's data centres are connected via multiple diverse 1Gbps circuits provided by different suppliers. The network infrastructure has been designed so that in the event of a failure with one of the circuits all of the traffic will be routed via another circuit automatically.

Both data centres use split DX systems air-conditioning systems in an N+1 configuration, the loss of any one system will not affect the infrastructure's ability to maintain air temperature. System failure is tested as part of the facility checks carried out under the Business Continuity Plan.

Key environmental parameters are pro-actively monitored 24x7x365 by the Supplier's internal Operations function to ensure a suitable and compliant data centre environment is maintained.

#### Data Centre Hardware and Connectivity

The Supplier will provide the SBC's (Session Border Controller), Virtual Modem Servers (hosted on a Linux Server) via our Touch Cloud infrastructure.

Touch Cloud comprises of the following components.

- **Compute** - This is effectively a powerful array of servers. They run virtualisation software that allows multiple virtual servers to operate on the same physical server at the same time. To run this environment effectively and efficiently requires high processing power, large RAM and high bandwidth network connections. They are typically referred to as host servers.
- **Network** – An enterprise grade Juniper switching fabric is deployed and used to provide high availability network connectivity between Compute, Storage and WAN.
- **Storage** – The Supplier provides a high-performance Storage Area Network (SAN) which comes in two parts, Head units that have the disk controllers and a shelf of disks, and then shelves that just have storage disks. Storage volume can easily be increased by adding more shelves. The Supplier has the ability to do this live without impacting the SAN service, so storage can be easily scaled.
- **Virtualisation Software** - The virtualisation layer provides the means to create Virtual Servers (VM's). The VM creates an environment that looks identical to a

	<p>physical server, so the operating system and application that run within the VM are not aware of the separate physical components beneath. This allows multiple VM's to run on a single physical server and for them to be moved between servers on the fly without impacting the services delivered by applications. This provides large economies of scale, resilience from hardware failure and huge scalability.</p> <ul style="list-style-type: none"> <li>• <b>Backup</b> - Veeam software will be used to back up the Touch Cloud servers.</li> </ul> <p>The Supplier will provide the following Touch Cloud infrastructure:</p> <ul style="list-style-type: none"> <li>• 6 x virtual SIP router / SBC Server instance</li> <li>• 4 x virtual SAMS server instance</li> <li>• Firewall and Network management to ensure the security of the infrastructure and enable connectivity with your Network Hub</li> </ul> <p>In Year 2 of the contract dependant on whether the Buyer is able to reduce the number of SIP ports required, the Supplier will review the number of servers within the infrastructure. If the Buyer meets the optimal target of 300 SIP ports the server infrastructure will reduce to the following:</p> <ul style="list-style-type: none"> <li>• 4 x virtual SIP router / SBC Server instance</li> <li>• 2 x virtual SAMS server instance</li> </ul>
