Schedule 4 - Statement of Requirements

Background.

1. The Wildcat helicopter fleet has an embodied Health and Usage Monitoring System (HUMS) which utilises vibration sensors to record the vibration levels in the aircraft gearboxes, drive train, engines and rotor systems. The embodied HUMS processes raw vibration signals to generate Condition Indicators (CIs) which are indicative of the health of all gears, bearings and shafts within the monitored systems. Analysis and trending of the CIs provides information relating to component wear and damage.
2. A HUMS alerting mechanism is implemented on a ground support system, using a combination of fixed and on aircraft learned thresholds. High vibration events are identified by a threshold exceedance which is then investigated and monitored by aircraft maintainers. Each aircraft generates data for circa 400 CIs which makes manual analysis and aircraft monitoring highly challenging, especially on a fleetwide basis.
3. While existing automated alerts can be highly effective in detecting certain fault conditions, this approach can be less effective at alerting for other subtle, rapidly progressing faults. This is where the complimentary approach of anomaly detection is beneficial. Through the use of an anomaly detection algorithm, which compares the behaviour of each individual CI for the component, rapidly developing fault conditions may be identified before component failure and before an exceedance alert is triggered.
4. This project seeks to procure an automated CI data analysis capability using anomaly detection which will help identify early onset of component damage. This would enable informed monitoring and fault management using other established methods such as Wear Debris Analysis (WDA) and Lubricating oil Analysis.

Requirement.

5. A civilian data analytics company are required specialising in aircraft engineering data solutions to take an initial Programme Nelson anomaly detection algorithm (developed in 2019) which was proven to have some success and develop and incorporate it into a software application that is useable by front line aircraft engineers.

Description of Work.

6. The civilian contracted company will be required to take the initial Python coding developed by Programme Nelson and refine its coding for improved functionality past the initial trial working in conjunction with 1710 NAS SME's.
7. The coding should then be incorporated into a Windows or Webb Application compatible solution with an appropriate graphical user interface again working with 1710 NAS SME's for direction and guidance on recommendations for solutions.

Deliverables.

8. Functioning analysis tool with software wrap around that will aid and prioritise deeper HUMS analysis by HUC and 1710 NAS personnel.

9. System to fully function on Wildcat HMA Mk2 and AH2 initially with future capability for additional airframe types to be incorporated.

Contract Start Date and Duration.

10. Contract should start as soon as possible however no later than Q4 2022 to allow integration into normal working practices by Q2 2023 (12 months from now).

Security Considerations.

11. Data accessible to company will be at Official level. Any Official sensitive data will be sanitised prior to providing it to the company. Company when working on MOD property will be under escorted visitor passes. Unit Security Officer aware of project.

Other Considerations.

12. All Intellectual Property rights for the solution should be retained by the MOD. Ability for 1710 NAS App developer SME's to work with company to develop solutions is essential to help grow in house experience.
13. All source code shall be provided to MOD.

Government Furnished Equipment/Information (GFE/GFI).

14. Contracted company will have supervised access to data and SME support as required. Able to work within 1710 building where required to aid complementary working. Normal office workspaces will be provided.
