INTRODUCTION

This Fire Protection Survey was conducted by Harvey Davies and Max Tyrell of Nene Valley Fire and Acoustics Ltd, to investigate any potential breaches within the compartmentation walls at Haylock House, Kettering. Included within this report are photographs alongside lists of recommendations required to reinstate the substrate's full fire integrity. It is important to note that the drawings provided prior to our survey simply depict the core and stairwells – partitions between office areas and additional rooms are not included. Despite this, a pinned drawing has been produced for each seal.

We have surveyed the presumed fire lines. In a lot of the building the floors are raised access. We have surveyed the underfloor where cavity barriers are present and under fire doors. There is evidence that the cavity barriers under floor are no longer fully intact and may require replacing.

It is possible that there are penetrations entering into the underfloor cavity along the fire walls however the placement of services and penetrations identified were present at risers. We have inspected above the suspended ceiling and have identified cavity barriers with no areas exceeding 20 meters. Each office area has its own means of escape via their respective stairwells. As the floor slab is constructed from concrete, we have presumed there is no cavity between each floor.

The drawings show the stairwells and block walls in the core the building. Walls have been added for office divisions, on Floor 1 West entering the office area there is a lobby housing the 'Electrics' riser and a wall either side with entrances to the offices. These walls have been presumed not to be fire rated due to the construction. There are differences between the drawings and the current layout of the building. For example, on Floor 2 on the West the Marked door on the drawing beside 'Vending' it is in fact located approximately 6 Meters left of it shown location, it is line with the right service riser wall.

We have treated the Dishwasher room within the restaurant as a compartment. The penetrations have been surveyed listing recommendations. A fire door has been recommended for this room Seal Id HD-00014

Seal ID HD-0166 shows a cleaners storage cupboard. We would recommend for the items to be moved to a fire rated cupboard or the area to be brought up to Fire Rated Cupboard specification.

Seal ID HD-0119 shows the store door in the kitchen. We would recommend for this to be a Fire Door.

Some doors throughout the building are incorrectly marked as Fire Doors. Seal ID HD-0306

Key

Required Fire Rating	Definition
30 Min F/S Infill	30 minute fire compartment, Fire Stopping, Infill – ablative batt and intumescent mastic to be utilised to seal the void within the substrate, usually used for a solid substrate.
30 Min Pattress Fix	30 minute fire compartment, Fire Stopping, Pattress – ablative batt and intumescent mastic to be utilised to seal the void, mechanically fixed onto substrate with a minimum of 100mm overlap, usually used to protect a cavity walls.
60 Min F/S Infill	60 minute fire compartment, Fire Stopping, Infill – ablative batt and intumescent mastic to be utilised to seal the void within the substrate, usually used for a solid substrate.
60 Min Pattress Fix	60 minute fire compartment, Fire Stopping, Pattress – ablative batt and intumescent mastic to be utilised to seal the void, mechanically fixed onto substrate with a minimum of 100mm overlap, usually used to protect a cavity walls.
120 Min F/S Infill	120 minute fire compartment, Fire Stopping, Infill – ablative batt and intumescent mastic to be utilised to seal the void within the substrate, usually used for a solid substrate.
120 Min Pattress Fix	120 minute fire compartment, Fire Stopping, Pattress – ablative batt and intumescent mastic to be utilised to seal the void, mechanically fixed onto substrate with a minimum of 100mm overlap, usually used to protect a cavity walls.
Acoustic Seal	Seal to be completed for acoustic protection only.

Installation Type	Description / Installation & Materials required
PEGM	Pressure exerting graphite mastic,
Batt LN	Void which is over the length of a linear metre, One layer of ablative batt, sealed both sides with intumescent mastic, multi coat.
Batt LN (double layer).	As above, when access is only possible from one side. Two layers of ablative batt, sealed from one side with intumescent mastic, multi coat. Two layers are required to ensure that a double mastic seal is achieved.
Trapezoidal	Void at the head of a wall to the underside of soffit profile. One layer of ablative batt, intumescent mastic, multi coat
Trapezoidal (double)	As above, when access is only possible from one side. Two layers of ablative batt, intumescent mastic, multi coat.
Mastic LN metre	Void which is over the length of a linear metre up to 10mm wide. Seal void with intumescent mastic.
Cable	A single cable breaching through substrate. Intumescent mastic or PEGM can utilised to seal cables dependent on size and type.
Cable tray	Cable trays are sealed using ablative batt and mastic, where penetrations require a closure PEGM (pressure exerting graphite mastic) is utilised.
Cable bunch	Two or more cables grouped together breaching through a substrate. Intumescent mastic or PEGM can utilised to seal cables dependent on size and type.
Cable trunking	Capped cable trunking is sealed using ablative batt and mastic, an intumescent pad or intumescent pillow is installed within the trunking.
Duct	Where ducting passes through a fire line we would normally expect to see a fire/smoke damper installed. A smoke seal can be achieved utilising intumescent mastic.
Conduit	A plastic or metal tube of a diameter no more than 25mm. Intumescent mastic or PEGM/ pipe collar utilised to seal.
Metal pipe	Metal pipe of any diameter penetrating substrate, sealed with intumescent mastic, up to a maximum of 10mm between pipe and substrate. Any larger void will require ablative batt as part of the installation
Pipe hole	Redundant pipe hole, can be sealed with intumescent mastic and ablative batt dependent size.
Cable hole	Redundant cable hole, can be sealed with intumescent mastic and ablative batt dependent size.
Plastic pipe	Plastic pipe of any size and material base passing through a cavity void, wall, ceiling or floor, Sealed with intumescent mastic / endless wrap / graphite mastic / pipe sleeves / pipe collars dependent of substrate, type and size.
Insulated metal pipe	Insulation can either be removed and replaced with a fire sleeve or a closure can be attached utilising either endless wrap, PEGM or a pipe collar (solution dependent on pipe and insulation size).
Hole	Ablative batt installed to close the void, sealed with intumescent mastic, penetrations dealt with separately.
Quantity	Number of penetrations or metres, i.e. for Mastic LN Metre a quantity of 8 would require 8 linear metres of intumescent mastic.
Girths	The size of the void for infills or required batt for a pattress.

Caveats and Exclusions

Nene Valley Fire and Acoustic Ltd, both professionally and practically, makes every effort to accurately survey and assess the current and required structural fire protection in the building.

This survey is a non-invasive visual inspection of the Passive fire protection elements of the fire partition lines as directed / or drawings supplied which is carried out in line with the requirements of **LPS 1531**.

This survey is limited to passive fire protection. We do not carry out a full structural survey of the building or assess, load-bearing capability. We do not carry out inspections of intumescent paint on steel as part of this inspection.

As such without this complete information, various assumptions need to be made: -

E.G. The fire integrity of the partition substrate line, where fire walls are noted within drawings or have been directed is taken at face value and that they have been built / installed to manufactures specifications, as such this gives the required specification and fire integrity rating, we cannot clarify or substantiate that this is the case.

Obvious defects to the fire compartmentation will be noted where possible.

Where the manufacturer of the materials cannot be established, similar materials will be used to remediate. However, these will have a nominal fire rating; the risk will have to be accepted by the client. Or the area removed, and a new seal installed.
