| 3.1 | <b>Supplier Software and Licences:</b>     | As per the customer requirements the delivered solution will only use permissively licensed free and open-source software, at this stage the solution is not fully know but will adhere this this fact. Any custom software artefacts/source generated as part of this project will be supplied to the customer with no limitations attached as per the framework. It is worth noting that we have a skeleton end to end capability for some of the integration of these products, which we have done as part of internal capability development, hence we will be re-using some existing purple ipr within the project. However this represents a cost saving to dstl where these components are re-usable. These components will also be made available to dstl. |

### 3. DELIVERABLES

Alongside the Customer team, the Suppliers in partnership will be responsible to assist in delivery of the following:

- the proposed overall solution architecture, including choice of deployment platform, operating system and technologies selected for each component of the system. The described solution should include assumptions, dependencies, risks and mitigations that are considered important for implementation, e.g. Integration of baleen entity extraction software into the data collection pipeline.
- the analyst user stories and an initial prioritisation schedule. The project kick-off planning meeting will be an opportunity for the supplier to work with the dstl project team to elicit the key user stories and to derive a first take on the priority of these user stories. There should also be an initial view of the user interface that will allow analysts to interact with the data that is collected. This will also be informed through interaction between the supplier and dstl.
- the statistical algorithms that will be used for work package 1 and a prioritisation based on importance/benefit provided by the method. There should also be an initial view of the stage, alpha or beta, where each algorithm would be implemented and assessed.
- a high level plan of the code sprints planned for the alpha and beta phases of development. The plan should include information about the sprint timeline, plans and proposed suitable times for briefing progress to the analyst group, technology solution to be implemented, level of dstl engagement, user stories to be addressed and proposed outputs from the sprint. The outputs will be based on the deliverables' table provided in the original statement of requirement (see schedule 1 of part b earlier in this document). The use of agile development means that some of these details will change during the course of the project and these changes will be agreed between the supplier and dstl.
- collaborative working arrangement plans, including software version control, issue tracking and access to code base for deployment on dstl systems. The discovery phase should decide on the most effective means of communication between the supplier and dstl. The chosen solution will be tested to ensure that it is fit for purpose for the next statements of work for the alpha and beta phases.
- an initial plan of the stages where a minimum viable product will exist to support planning for exposing the work to end users for feedback. This will allow dstl to schedule access to mod analysts to assist with the evaluation of the solution that is developed.

PLEASE NOTE
