Schedule 2 - Specification

The Suppliers shall provide the Goods and/or Services in accordance with this Schedule

The UKRI British Geological Survey (BGS) Geochronology and Tracers Facility (NEIF-GTF) requires the supply, delivery, and installation of a state of the art, new multicollector thermal ionisation mass spectrometer (MC-TIMS) with high performance ion counting detector and low-noise high-sensitivity Faraday amplifier system at its high precision U-Pb geochronology laboratory at the BGS, Keyworth, Nottingham, UK.

Installation of the instrument and acceptance testing at NEIF-GTF by a qualified installation engineer is required, with training to be arranged through consultation with NEIF-GTF staff and the supplier.

NEIF-GTF requires the delivery, installation and acceptance testing of the instrument to be completed within 6 months of the placement of the order or by end March 2020, whichever is first.

Procurement of the new MC-TIMS ensures NEIF-GTF's geochronology facility's ability to fulfil current analytical demands from its user community, in light of NEIF-GTF's recent commissioning for the next 5 years by NERC, and provide analytical capability that will allow NEIF-GTF to further grow its analytical program for the good of the UK and international scientific community.

The requested analytical capabilities for the new MC-TIMS are based upon NEIF-GTF's current MC-TIMS performance capability and needs, the capabilities of state of the art MC-TIMS described in the principal manufacturers literature and their conference presentations, manufacturers and expert users unpublished test results, and NEIF-GTF staff visits to all the relevant mass spectrometer manufacturer's factories.

High precision U-Pb geochronology is a cornerstone of NEIF-GTF research and MC-TIMS is the requisite analytical instrumentation for undertaking the U and Pb isotope measurements critical to this work. A new MC-TIMS is required to sustainably underpin NEIF-GTF's current high- and increasing-demand geochronology research program. The new MC-TIMS will become NEIF-GTF's primary instrument for U-Pb isotope measurements on trace uranium (≤ 1 ng) and lead (<100 pg to < 1 pg) whose routine analysis is required. The new MC-TIMS will take on this role following commissioning, in-house performance testing and establishment of measurement protocols.

Static Faraday multicollector, static multicollector Faraday - single ion detector (secondary electron multiplier [SEM] or Daly detector), and single ion detector dynamic peak jumping measurement capability is essential to NEIF-GTF's U-Pb geochronology program. An important driver for NEIF-GTF's new MC-TIMS is exceeding its current MC-TIMS capability through improved running efficiency, manifested as either more useful data collected per typical analysis time period or shorter analysis time. It is anticipated that such improvement will require gains achieved as a function of instrument design leading to (a) improved ionisation efficiency (the sum of efficient ion generation in the ion source region paired with efficient ion transmission through the MC-TIMS), and (b) improved sample running efficiency through faster peak jumping duty cycle, and/or lower cross-over point of efficient Daly/SEM to Faraday measurement, and improved ion counter (SEM or Daly) – Faraday gain stability.

The critical things that the MC-TIMS will have or be capable of are:

- (1) Be fitted with a pumping system that maintains a low organic load on the mass spectrometer ion source region and flight tube, and similar on the filament degas device used for preparing filaments prior to sample loading and analysis. This low-organic level vacuum system needs to incorporate dry backing pumps to any turbo molecular pumps used in the mass spectrometer or degas device.
- (2) A degas device for preparing filaments ready for sample loading is to be included in the main mass spectrometer price and not as an extra cost or optional item. The degas device should be capable of holding ~20 filaments (or more) at a time.
- (3) An optical pyrometer is required to be fitted to the mass spectrometer and included within the main mass spectrometer price, and not as an extra cost or optional item. This is an essential device required by NEIF-GTF for U-Pb analysis.
- (4) The new mass spectrometer will match or exceed the current NEIF-GTF TIMS performance level specifically relating to single ion detector dynamic peak jumping analysis for Pb and U oxide; where peak jumps for Pb are in the sequence mass 201 (interference), 202Pb, mass 203 (interference), 204Pb, 205Pb, 206Pb, 207Pb, 208Pb; and where peak jumps for U are in the sequence mass 265 (233U oxide), mass 267 (235U oxide), mass 270 (238U oxide) and mass 272 (238U oxide). During these analyses the single ion detector will have the minimum performance specification of 0 – 1E+06 cps acceptable operational window, linearity to $\pm 0.1\%$ from 1E+03 cps to 1E+06 cps, dark noise <20 cpm, and a peak top which is flat to $\pm 0.1\%$ over ± 50 ppm of mass around the peak centre.

The specification of computer required to operate the MC-TIMS should be detailed. NEIF-GTF will supply the computer which will use a Windows 10 operating system. All instrument software required to run the mass spectrometer should be provided and installed during the installation period.

The new MC-TIMS will be capable of making the following isotope ratio measurements and meeting the following performance characteristics:

- (5) Static multicollector Faraday Pb isotope measurements, where the masses 202Pb, 204Pb, 205Pb, 206Pb, 207Pb, 208Pb are each measured in a separate Faraday detector; and static U oxide isotope measurements where the masses 265 (233Uoxide), 267 (235Uoxide), 270 (238Uoxide) and 272 (238Uoxide) are each measured in a separate Faraday detector. The Pb and U measurements would be separate experiments.
- (6) Static multicollector Faraday – ion detector measurements of masses 202Pb (Faraday), 204Pb (Daly or SEM), 205Pb (Faraday), 206Pb (Faraday), 207Pb (Faraday), 208Pb (Faraday); and in a separate experiment the masses 265 (Faraday), 267 (Faraday), 270 (Faraday), and 272 (ion counter) . Ion counter/Faraday relative efficiency (variously termed gain or yield by manufacturers, termed here as yield) is to be stable to better than $\pm 0.5\%$ over the course of a sample measurement (≤ 60 minutes). Stability of the yield at much better levels, e.g. $\pm 0.2\%$ is highly desirable.
- (7) Dynamic (two peak jump) multicollector Faraday – ion detector measurements with masses 202Pb (Faraday), 204Pb (Daly or SEM), 205Pb (SEM or

Daly/Faraday), ^{206}Pb (Faraday), ^{207}Pb (Faraday), ^{208}Pb (Faraday). Ion counter/Faraday yield to be calculated from static ^{205}Pb (SEM or Daly)/ ^{206}Pb (Faraday) and static ^{205}Pb (Faraday)/ ^{206}Pb (Faraday) measured isotope ratios. The derived yield factor is to be stable to better than $\pm 0.2\%$ (95% confidence level) over the course of a sample measurement. The internal precision of yield-corrected isotope ratios should be largely accounted for by the yield factor uncertainty propagated with the ion beam counting statistics as measured for a stable ion beam (i.e. where contributions to uncertainty due to beam size variations are not a factor). Within run precision of the yield – corrected isotope ratios at levels at the $\pm 0.1\%$ (95% confidence level) for the yield component of the uncertainty or better is highly desirable.

- (8) Dynamic single collector peak jumping Pb and U isotope measurements on a discrete dynode Daly or SEM detector where peak settle times, peak measurement times can be flexibly assigned in the operating software to optimise data collection efficiency. Time-stamped beam interpolation for correction of ion beam intensity drift during the measurement is essential. The measurements that the MC-TIMS shall be capable of delivering in peak-jumping mode are (i) m/z 201 (interference), ^{202}Pb , m/z 203 (interference), ^{204}Pb , ^{205}Pb , ^{206}Pb , ^{207}Pb , ^{208}Pb and shorter derivative sequences; and (ii) m/z 265 (^{233}U oxide), m/z 267 (^{235}U oxide), m/z 268 (^{236}U oxide), m/z 270 (^{238}U oxide), and m/z 272 (^{238}U oxide), and shorter derivative sequences.
- (9) That there are minimal to no isobaric interferences arising from organics originating off mass spectrometer source parts or the pumping system. Compliance with this condition would be evidenced by isotope ratio measurements critical to zircon geochronology being consistent within uncertainty throughout a typical radiogenic Pb analysis (e.g. $^{206}\text{Pb}/^{204}\text{Pb} = \sim 20\text{-}10000$, as measured for a 5-50 pg total Pb sample loaded with silica gel on zone refined Re with a loading blank of <0.1 pg Pb, Daly or SEM single collector peak-jumping analysis), or at worst that the isotope ratios plateau out at an internally consistent value after 20 minutes of run time within a Pb isotope single collector peak jumping analytical run (typically 1.5-3 hours total duration).
- (10) Only new mass spectrometers supplied directly from the place of manufacture from established bona fide MC-TIMS instrument manufacturers are acceptable under this “provision of a multicollector thermal ionisation mass spectrometer”. Refurbished and/or upgraded previously-owned (used or unused) instruments, or otherwise new instruments containing any components or sub-systems that have been previously used or refurbished, are completely unacceptable for this “provision of a multicollector thermal ionisation mass spectrometer”.
- (11) It is essential that the software be capable of performing ion beam – time interpolation for on-line correction of single-collector peak jumping measurements and it is essential that the software is capable of outputting time-stamped data.

NEIF-GTF geochronology staff have ~ 200 person years collective multicollector and single collector mass spectrometry experience.

The new MC-TIMS is to be installed in a room already housing two MC-TIMS instruments. The room air is conditioned and HEPA filtered to $\sim$ ISO 6 air quality. The room has housed MC-TIMS instruments since 1990. The new instrument will be placed > 3 m from adjacent TIMS instrument magnets.

The available floor space to accommodate the new instrument footprint is >3m x >3m. Services to the room include piped dry nitrogen, 125 psi compressed air, all electrical circuits on UPS, 240 VAC. High purity liquid nitrogen is readily available from a large supply tank just outside the TIMS laboratory.

A willingness of the instrument provider to work with NEIF-GTF staff to optimise the potential and push the capability of the instrument for U-Pb isotope measurement is not essential but would be very welcome.

Where it is possible for NEIF-GTF to supply a suitable PC with Windows 10 and Office software it is requested that the manufacturers supply the requisite specifications for the hardware and software.

The core MC-TIMS package to be quoted should include a 20+ filament degas device, TIMS operating software, and a core MC-TIMS instrument (e.g. Triton XT/Phoenix/Nu TIMS) fitted with the following essential components to facilitate U-Pb isotope analysis: High performance ion counting device (discrete dynode SEM or Daly photomultiplier system);

Faraday amplifier system fitted with the manufacturers highest performance lowest background noise amplifiers (e.g. combination of 10^{11} and 10^{13} ohm amplifiers (5), or Atona system, or standard 10^{11} ohm amplifiers plus 6 Faradays fitted with switchable 10^{11} , 10^{12} and 10^{13} ohm amplifiers), as applicable to the particular MC-TIMS;

Minimum of 9 Faraday detectors for TIMS with movable cups, or for fixed detector instruments the manufacturer is to specify the Faraday cup configuration appropriate to the analytical requirements described by NEIF-GTF;

Oil-free turbomolecular pump (e.g. ceramic bearing with sufficient seals) and oil-free backing pump (e.g. scroll or roots pump or equivalent) that pump the ion source region; Sample magazine;

Computer controlled isolation valve between source and analyser vacuum; Ion lens assembly/collimator;

Warp or RPQ filter on the ion beam path to the high performance ion counting device used for single collector peak jumping analysis if it is specifically required for obtaining the optimum peak shape, peak flat, and optimized performance on the ion counting device;

Pyrometer;

Delivery, on-site set-up and testing to achieve instrument performance specification.

Optional extras to be priced as additional items separate from the core MC-TIMS package quote to include:

Energy filter (Warp or RPQ device) on the ion beam path to the high performance ion counting device used for single collector peak jumping analysis in the instance that the filter only is required for optimizing the abundance sensitivity for the ion counting device;

A second ion counter (Daly) in the case of a fixed Faraday collector instrument;
Liquid nitrogen cryopump;

Spare ion source/collimator;

Spare sample magazine;

1 year typical spares kit including single and double filament supports, cover slits for filament assemblies, specialist tools that comprise the manufacturers normal kit for new mass spectrometer purchases;

Water chiller for magnet and turbopumps if required;

One filament preheat assembly in addition to the main filament heating assembly in the ion source region.

General requirements: Tenderers are requested to include the following in their response to tender:

- (12) A breakdown of costings for all items included in the instrument hardware, associated PC, and software.
- (13) Details of third party components included within the specifications which UKRI BGS could purchase directly from manufacturers (e.g. computer hardware, operating system and MS Office software, vacuum system components)
- (14) Details of warranty provisions,
- (15) Details and costings of spares kit,
- (16) Details of maintenance arrangements/agreements,
- (17) Details of service engineer's call out charges (per day).

Key specification's that NEIF-GTF deem to be prerequisites to achieving our scientific objectives are as follows. The instrument and its operating software will be capable of:

- (18) Dynamic peak jumping and static multicollector analysis of U and Pb isotopes as outlined in above is essential. Proven capability of making zircon geochronology U-Pb isotope measurements is desirable.
- (19) Single collector dynamic peak jumping analysis capability (i) employing a Faraday cup for large ion beams and (but not simultaneously) (ii) employing a highly linear ion-counting device (SEM or Daly) for $\leq 10^6$ count per second (cps) ion beams with time-stamping of the data and on-line beam-interpolation correction is essential. An axial ion counting device (or its nearest equivalent in fixed Faraday position multicollector instruments) should be of a discrete-dynode secondary electron multiplier (SEM) or Daly-type detector.
- (20) The ion counting device should be linear at the 0.1% level for ion beams from 10^3 cps to at least 10^6 cps.
- (21) The ion counting device, if an SEM, should have a maximum dark noise of ~10 counts per minute (cpm) on installation at NEIF-GTF. SEM dark noise < 2 cpm

- would be desirable. In the instance of a Daly detector, ≤ 10 cpm dark noise achieved within 6 months of installation.
- (22) In the event that NEIF-GTF purchase a high abundance sensitivity energy filter (e.g. RPQ, or Warp energy filter, or similar) for the axial (or nearest to axial position) ion counting device that it be capable of achieving ≤ 50 ppm abundance sensitivity at $\geq 90\%$ transmission.
- (23) In the instance of a Daly-type ion counting device, the physical position of the Daly knob relative to the ion beam path and the Daly detector scintillator window should be optimised to provide the maximum width flat topped peak characteristics under the widest range of instrument tuning conditions.
- (24) In the instance that the principal ion counting device is an SEM, NEIF-GTF requires an SEM that will give reliable performance for ≥ 5 yrs averaging $\sim 2\text{E}+12$ counts per year while maintaining dark noise < 20 cps and linearity as per point (9) above. (For reference, NEIF-GTF's Triton 2 SEM counts = $1.7\text{E}+12$; Jan 06 – Dec 28 2018, within dark noise and linearity specification limits given in point 9 and 10 above). The SEM when requiring eventual replacement should be serviceable by experienced NEIF-GTF staff.
- (25) Multi-collector Faraday detector array: for movable collector assemblies the low mass Faraday cups will be positionable to achieve uranium oxide spacing for m/z 265, 267, 270 and 272, and first low mass Faraday plus axial and high mass Faraday cups to Pb isotopes ^{202}Pb , ^{204}Pb , ^{205}Pb , ^{206}Pb , ^{207}Pb , ^{208}Pb .
- (26) Multi-collector Faraday detector array: for movable collector assemblies the Faraday cups will be sufficiently adjustable to permit static and multi-dynamic measurement of Sr and Nd isotopes in addition to the Pb and Uoxide cup configurations.
- (27) Multi-collector Faraday detector array: for fixed position detector arrays the array should be optimised for U and Pb measurement but where possible have capability for Sr and Nd isotope measurements.
- (28) A minimum of 5 Faraday detectors should be connected to high-sensitivity amplifiers (e.g. $1\text{E}+13$ ohm amplifiers), or the equivalent high-sensitivity and wide-range proprietary devices. A high-sensitivity amplifier system permitting measurement of isotope ratios with an internal precision (uncertainty) of $\pm 0.1\%$ (95% confidence level) given a minimum ion beam intensity of $\leq 30,000$ cps would be highly desirable.
- (29) The sample wheel should be capable of holding ca. 20 sample filaments.
- (30) The source will be fitted with (i) an isolation valve between the flight tube and the thermal ionisation source region that is controllable by the software in either automatic (computer controlled) or manual running modes; (ii) fitted with an optical pyrometer for monitoring filament temperature; (iii) capable of being fitted with at least one filament preheat position for sample preconditioning.
- (31) The vacuum system will be protected against power interruption such that there are fail-safe devices resident that isolate high vacuum regions from low vacuum/ambient pressure regions to eliminate risk of venting high vacuum regions to atmosphere.

- (32) The turbo-pumping system shall provide a sustainable source pressure of $\leq 2\text{E-}07$ mbar within 4 hours from start of pumping down from atmosphere, where attaining this sustainable pressure within 2 hours would be desirable.
- (33) The vacuum pressures shall be monitored in all critical locations within the TIMS instrument (e.g. turbo pump backing line pressure, source region pressure, flight tube pressure) and displayed by the control software.
- (34) The ultimate flight tube pressure, as maintained by ion pumps or turbomolecular pumps, will be sufficient to provide an abundance sensitivity of 2 ppm or better at the Faraday detectors on a continuous basis and not as a transient feature dependent upon special operating conditions or use of an RPQ or Warp filter device.
- (35) The turbomolecular pump that evacuates the source region, and its dry backing pump, are to provide a virtually oil-free vacuum to the mass spectrometer. Under no circumstances are oil-based rotary pumps permitted as backing pumps to the turbo pump or any other part of the instrument (e.g. amplifier housing).
- (36) Bake-out devices and their controllers are to be provided.
- (37) The pumping system will provide a sustainable source region vacuum of ca. $2\text{E-}07$ mbar or better after pumping down from atmosphere within ca. 4 hours from start of pumping.
- (38) The magnet will be capable of a mass range of m/z of at least 5 to 300.
- (39) The magnet and magnet field regulation system shall provide a peak side stability of at least ± 50 ppm of mass over ≥ 30 minutes as measured on the ^{238}U oxide peak ($m/z = 270$).
- (40) Mass resolution shall be ≥ 400 with flat-topped well-defined peaks as measured on either the Faraday detectors or SEM/Daly detector(s).
- (41) The magnet shall have a settling time of 2 seconds or better where the mass positioning is within ± 100 ppm of the desired mass for a small m/z jump (e.g. ^{206}Pb to ^{207}Pb , 267 (^{235}U oxide) to 270 (^{238}U oxide)). Settling times should be specified for the type of magnet supplied on the MC-TIMS and if data are available, for small and large mass range jumps.
- (42) Operating software for the instrument should permit versatile measurement protocol writing. Flexible operation $\pm$ open source is highly desirable.
- (43) There should be auto-resetting of the ion counter in the instance of tripping due to exposure to large ion beams.

Instrument installation, performance specification achievement, and acceptance by relevant NEIF-GTF staff shall be completed before March 27th 2020 to ensure final payment achieved by end of financial year deadlines. This timing is fundamental to successful purchase of the MC-TIMS and final acceptance by mid-March 2020 would be preferable.

The instrument will be expected to achieve the manufacturer's standard performance acceptance criteria. In addition, the ion-counting detector will be expected to achieve the minimum specifications listed in section 4 specification 4 above.

Delivery to British Geological Survey, Keyworth, Nottingham, NG12 5GD, UK can happen between 9 AM – 5 PM, Monday-Friday. Easy access to the mass spectrometry laboratory is via double fire doors to the outside that can be opened fully for access. Previously installed MC-TIMS instruments have come through those doors. Installation engineers may only work during standard BGS hours, 7 AM – 7 PM, Monday-Friday.
